	Regime	

Field-Level Failure Frequency

Number of times each required field failed validation, summed across all 28 trades and both regimes.

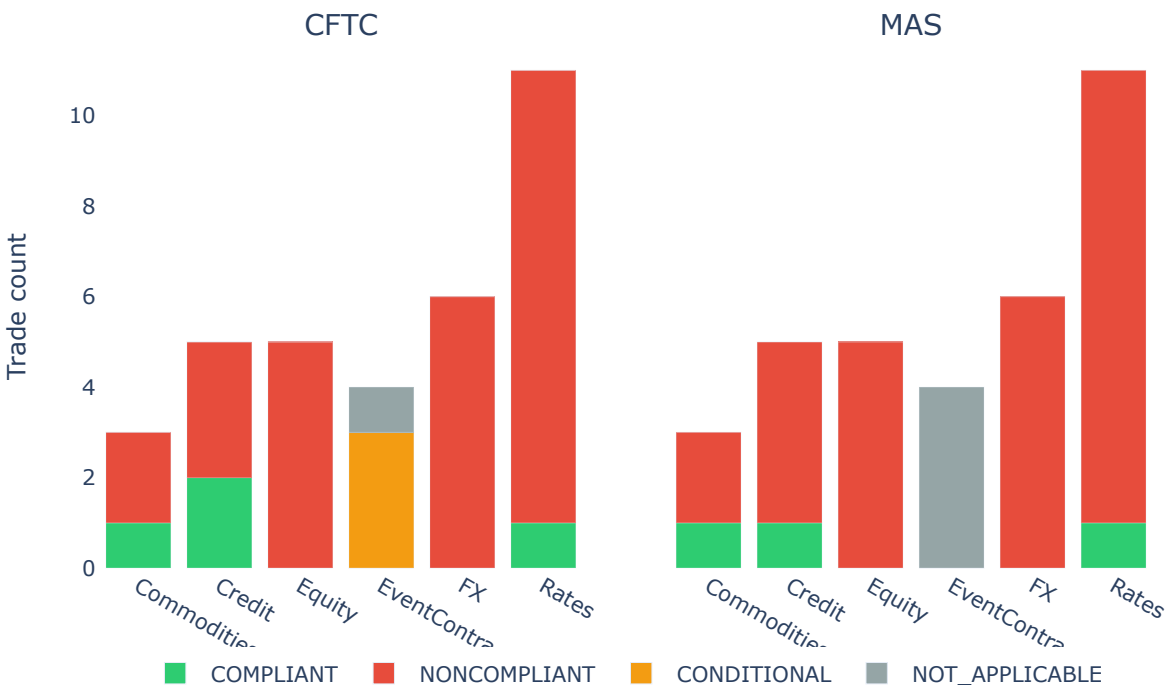

Field-Level Failure Frequency (28 trades x 2 regimes)

Asset Class Breakdown

Status distribution per asset class, side-by-side per regime.

Asset Class Status Breakdown

Classification Frontier — Prediction Contracts (T026–T028)

The three NOVEL trades fall outside the ANNA-DSB UPI taxonomy. Their CFTC / MAS status is determined by an applicability rule (venue + jurisdiction), not by field validation.

Trade	Platform	Platform type	CFTC	MAS	Description
T026	Kalshi	CFTC_REGULATED_DCM	CONDITIONAL	NOT_APPLICABLE	Binary event contract on German federal election outcome. Pays USD 1.00 per contract if AfD achieves over 30 percent vote share in the 2025 Bundestagswahl.

Trade	Platform	Platform type	CFTC	MAS	Description
T027	Polymarket	DECENTRALISED_BLOCKCHAIN_PLATFORM	NOT_APPLICABLE	NOT_APPLICABLE	Binary event contract paying USD 1.00 if US CPI inflation (all items, 12 month) exceeds 3.0 percent in Q3 2026 as reported by BLS.
T028	Kalshi	CFTC_REGULATED_DCM	CONDITIONAL	NOT_APPLICABLE	Binary event contract paying USD 1.00 if ESMA formally approves the EU AI Act Annex III high risk classification for credit scoring models before 31 December 2026.
T034	Kalshi	CFTC_REGULATED_DCM	CONDITIONAL	NOT_APPLICABLE	Binary event contract paying USD 1.00 per contract if the US Supreme Court issues a judgment before 30 June 2027 materially limiting FTC rulemaking authority over algorithmic decision-making, on post-Loper-Bright administrative-law doctrine.

Interpretation

Why so few COMPLIANT. Of the 8 distinct counterparty LEIs in the portfolio, **3 fail ISO 7064 MOD 97-10** (`2138002TXD6KSZ3V5X27` , `9695009AXSRNHZE85Y20` , `4R3ZURLYISNNNMHK608`). Only 3 of 25 conventional trades have both counterparties' LEIs valid (T013, T017, T021); T013 has a date-only `execution_timestamp` , T021 has

`maturity_date: "9999-99-99"` . T017 is the lone CFTC pass. T017 then fails MAS because its three collateral / margin fields are explicit `null` . The engine is doing what it is supposed to — surfacing the dataset's deliberate data-quality issues as legitimate compliance failures, not silently masking them.

Jurisdictional asymmetry for prediction contracts. T026, T027 and T028 are all binary event contracts with measurable economic exposure (a German renewable-subsidy hedge, an EU bond-portfolio inflation hedge, a FinTech compliance-cost hedge), but their reporting status flips entirely on venue. T026 and T028 trade on Kalshi (a CFTC-regulated DCM) → CFTC CONDITIONAL pending ANPR 91 FR 12516. T027 trades on Polymarket via VPN bypass → CFTC NOT_APPLICABLE. All three are MAS NOT_APPLICABLE. The instrument economics are unchanged; the regulatory perimeter is determined by where the order book sits and how the user accessed it.

MAS adds collateral / margin obligations CFTC does not. Of trades where every shared CDE field passes, MAS additionally requires `collateral_portfolio_code` , `initial_margin_posted` , `variation_margin_posted` — and a value of `0` is fine, it is `null` that fails. Trades T003, T004, T014, T017, T019, T020, T023, T025 that would otherwise pass CFTC's identifier and date checks fall over MAS because these three fields are simply absent from the trade record. The asset-class panel makes the cleared / collateralised trade types (Rates and Credit) visually compliant for MAS at a much higher rate than the typically uncleared FX and Equity ones.
